FUTURE ROCKET TRAIN

NEW MAGNETIC SCIENCE INDICATES THAT THE DAY WILL SOON COME WHEN ROCKET TRAINS, SUSPENDED BETWEEN SUPER-MAGNETIC RAILS, WILL FLASH ACROSS COUNTRY

The idea of controlled rocket travel is not a new one, Max Valier, German scientist, having built a rocket car on rails. But with the discovery of the marvelous magnetic properties of cobalt steel, which can be so highly and permanently magnetized that it will float in air when prepared in the form of two magnets with like poles opposing, new possibilities are opened up. Already this new metal is being used in the construction of delicate instruments. We envision the day when these uses will lead to larger fields, and the floating magnetic rocket train pictured here is one very possible phase of such development. A cobalt steel car, floating easily between cobalt steel rails, and powered by rockets, could conceivably flash across the continent at speeds in excess of 500 miles per hour. On page 145 we have treated in detail the futuristic train you see here. Copyright Amazing Stories, 1938.
